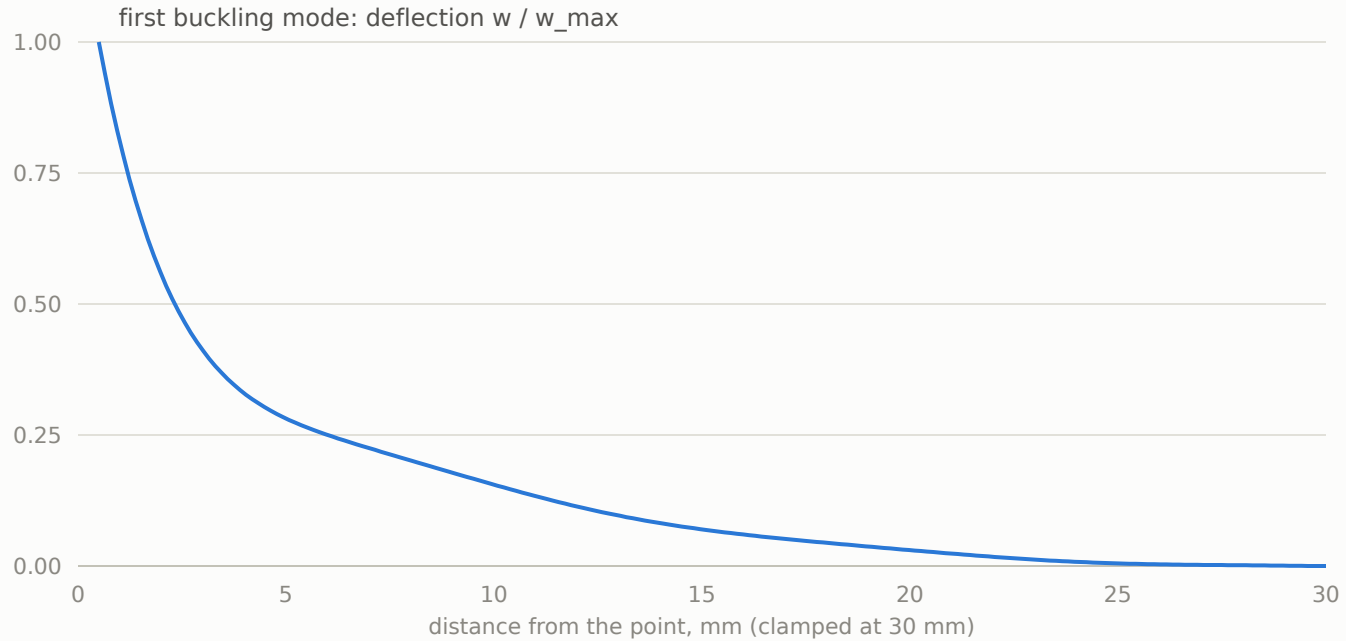
## Buckling of the point · λ = 11.94 (required 1.5) · margin 7.958

P_cr = 1790 N against the 150 N tip axial load; tapered column clamped 30 mm behind the point



Rayleigh-Ritz, 7 functions (1 - ξ)^(k+2) that satisfy the clamp; E·I(s) of the decoded sections (minor axis), 400 points. The mode comes from the same eigenproblem as the scored λ (eigenvectors accumulated alongside the Jacobi rotations). Reproduces the record's SF bit for bit (Tier 2 at h 0.2, same platform).
