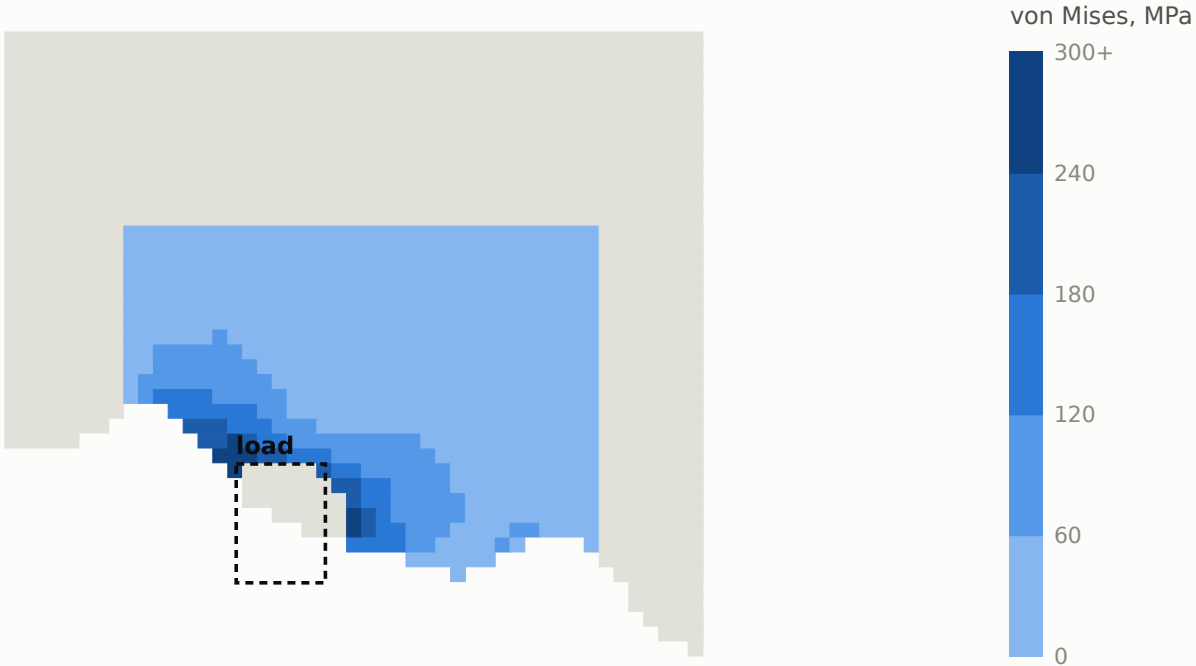
Teeth · hex8 SF 2.72 vs formula 2.38 (required 1.2)

governing tooth on the inner edge, x 114.3-119.7 mm, height 1.01 mm: 180 N snag along the edge, 20 N pry



Hex8 voxel FE on the AM field (h 0.2 mm), the tooth and 4 mm of blade (clamped), 18016 voxels · shown: snag
SF = allowable 751 MPa / 99.9 % quantile (snag 276, pry 59 MPa) · grey: not read (crest, clamp)
Cross-check of the notched root-section formula, not gated; h 0.2 mm voxels resolve the thin bevel coarsely.
